Partially dissipative systems: hypocoercivity and hyperbolisation

Timothée Crin-Barat

Friedrich-Alexander-Universität (FAU) Erlangen-Nuremberg

IRMAR, 21 Septembre 2023

 First part: Stability of partially dissipative hyperbolic systems

Second part: Hyperbolisation via partial dissipation

Stability of hyperbolic systems

We consider *n*-component hyperbolic systems of the form:

$$\begin{cases} \partial_t U + \sum_{j=1}^d A^j(U) \partial_{x_j} U + BU = 0, \\ U_0(x,t) = U_0(x), \end{cases}$$

where

- $U(x,t) \in \mathbb{R}^n$, $x \in \mathbb{R}^d$ or \mathbb{T}^d and t > 0,
- The matrices valued maps A^j are symmetric,
- The $n \times n$ matrix B is positive and symmetric.

Stability of hyperbolic systems

We consider *n*-component hyperbolic systems of the form:

$$\begin{cases} \partial_t U + \sum_{j=1}^d A^j(U) \partial_{x_j} U + BU = 0, \\ U_0(x,t) = U_0(x), \end{cases}$$

where

- $U(x,t) \in \mathbb{R}^n$, $x \in \mathbb{R}^d$ or \mathbb{T}^d and t > 0,
- The matrices valued maps A^j are symmetric,
- The $n \times n$ matrix B is positive and symmetric.

Three scenarios:

- When B = 0, small and smooth initial data lead to local-in-time solutions (Kato, Majda, Serre) that may develop shock waves in finite time (Dafermos, Lax).
- When rank(B) = n, existence of global-in-time solutions (Li) that are exponentially damped.
- Partially dissipative setting: 0 < rank(B) < n.

Partially dissipative structure

• For simplicity, we look at one-dimensional hyperbolic systems of the form

$$\partial_t U + A \partial_x U + B U = 0, \tag{1}$$

where A is symmetric and B is partially dissipative: $rank(B) = n_2 < n$, $n_1 + n_2 = n$ and

$$B = \begin{pmatrix} 0 & 0 \\ 0 & D \end{pmatrix} \quad \text{with } D > 0.$$

Partially dissipative structure

• For simplicity, we look at one-dimensional hyperbolic systems of the form

$$\partial_t U + A \partial_x U + B U = 0, \tag{1}$$

where A is symmetric and B is partially dissipative: $rank(B) = n_2 < n$, $n_1 + n_2 = n$ and

$$B = \begin{pmatrix} 0 & 0 \\ 0 & D \end{pmatrix} \quad \text{with } D > 0.$$

ullet Decomposing $U=(U_1,U_2)$, with $U_1\in\mathbb{R}^{n_1}$ and $U_2\in\mathbb{R}^{n_2}$, we have

$$\begin{cases} \partial_t \, U_1 + A_{1,1} \partial_x \, U_1 + A_{1,2} \partial_x \, U_2 = 0, \\ \partial_t \, U_2 + A_{2,1} \partial_x \, U_1 + A_{2,2} \partial_x \, U_2 = -D U_2, \end{cases} \quad \text{where } A = \begin{pmatrix} A_{1,1} & A_{1,2} \\ A_{2,1} & A_{2,2} \end{pmatrix}.$$

The symmetry of B implies that: there exists $\kappa > 0$ such that

$$\langle DX, X \rangle \ge \kappa ||X||^2$$
.

Applications

Examples of application • The compressible Euler equations with damping:

$$\begin{cases} \partial_t \rho + \partial_x (\rho \mathbf{u}) = 0, \\ \partial_t (\rho \mathbf{u}) + \partial_x (\rho \mathbf{u}^2) + \partial_x P(\rho) + \rho \mathbf{u} = 0, \end{cases}$$

For the pressure law $P(\rho)=A\rho^{\gamma}$, with A>0 and $\gamma>1$, we can rewrite System (5) into the symmetric form:

$$\begin{cases} \partial_t c + u \partial_x c + \frac{\gamma - 1}{2} c \partial_x u = 0, \\ \partial_t u + u \partial_x u + \frac{\gamma - 1}{2} c \partial_x c = -u, \end{cases}$$
 (2)

where $c=\sqrt{\frac{\partial P(
ho)}{\partial
ho}}$ corresponds to the sound speed.

• Partial dissipation occurs in many compressible models including dissipation: Compressible Navier-Stokes equations, Chemotaxis systems, Timoshenko systems, Discrete BGK, Euler-Maxwell equations, Sugimoto model, damped wave equation, Cattaneo's approximation etc.

Large-time stability for partially dissipative systems

Context

Goal: establish time-decay rates for

$$\partial_t U + A \partial_x U + B U = 0.$$

First difficulty: partial dissipation leads to an obvious lack of coercivity:

$$\frac{1}{2}\frac{d}{dt}\|(U_1,U_2)(t)\|_{L^2}^2 + \kappa\|U_2(t)\|_{L^2}^2 \le 0, \tag{3}$$

 \rightarrow no time-decay information on U_1 .

Context

Goal: establish time-decay rates for

$$\partial_t U + A \partial_x U + B U = 0.$$

First difficulty: partial dissipation leads to an obvious lack of coercivity:

$$\frac{1}{2}\frac{d}{dt}\|(U_1,U_2)(t)\|_{L^2}^2 + \kappa\|U_2(t)\|_{L^2}^2 \le 0, \tag{3}$$

 \rightarrow no time-decay information on U_1 .

Inspiration to tackle this issue: Theories of hypoellipticity (Hörmander), control (Kalman), and hypocoercivity (Villani):

"There might be regularizing/stabilizing mechanisms hidden in the interactions between the hyperbolic part A and the dissipative matrix B."

→ Let's see what how it looks like in the context of ODEs.

ODE toy-model

Consider the ODE

$$\partial_t U + AU + BU = 0 (4)$$

such that A is skew-symmetric and B positive symmetric (rank(B)< n).

Lemma

The following statement are equivalent.

• The pair (A, B) satisfies the Kalman rank condition:

$$rank(B, BA, BA^{2}, \dots, BA^{n-1}) = n$$
 (K)

• The solution of (4) with the initial data $U_0 \in L^2$ satisfies

$$||U(t)||_{L^2} \le Ce^{-\lambda t}||U_0||_{L^2}.$$

ODE toy-model

Consider the ODE

$$\partial_t U + AU + BU = 0 \tag{4}$$

such that A is skew-symmetric and B positive symmetric (rank(B)< n).

Lemma

The following statement are equivalent.

• The pair (A, B) satisfies the Kalman rank condition:

$$rank(B, BA, BA^2, \dots, BA^{n-1}) = n \tag{K}$$

• The solution of (4) with the initial data $U_0 \in L^2$ satisfies

$$||U(t)||_{L^2} \leq Ce^{-\lambda t}||U_0||_{L^2}.$$

Sketch of proof: Since A is skew-symmetric, we have

$$\frac{1}{2}\frac{d}{dt}\|U(t)\|_{L^{2}}^{2} + \kappa\|U_{2}(t)\|_{L^{2}}^{2} \le 0.$$
 (5)

Using the interactions between A and B,

$$\frac{d}{dt}\left(\sum_{k=1}^{n-1} < BA^{k-1}U, BA^{k}U > \right) + \sum_{k=1}^{n-1} \|BA^{k}U(t)\|_{L^{2}}^{2} \le C \|U_{2}(t)\|_{L^{2}}^{2} + \dots$$

Under the Kalman rank condition, we have

$$\sum_{k=0}^{n-1} \|BA^k U(t)\|_{L^2}^2 \sim \|U(t)\|_{L^2}^2.$$

Therefore, the following functional is a Lyapunov functional

$$\mathcal{L}(t) = \|U(t)\|_{L^{2}}^{2} + \eta \left(\sum_{k=1}^{n-1} \langle BA^{k-1}U, BA^{k}U \rangle_{L^{2}} \right)$$

verifying

$$\frac{d}{dt}\mathcal{L}(t) + \|U_2(t)\|_{L^2}^2 + \eta \|U(t)\|_{L^2}^2 \leq \eta \|U_2(t)\|_{L^2}^2.$$

Under the Kalman rank condition, we have

$$\sum_{k=0}^{n-1} \|BA^k U(t)\|_{L^2}^2 \sim \|U(t)\|_{L^2}^2.$$

Therefore, the following functional is a Lyapunov functional

$$\mathcal{L}(t) = \|U(t)\|_{L^2}^2 + \eta \left(\sum_{k=1}^{n-1} < BA^{k-1}U, BA^kU >_{L^2}\right)$$

verifying

$$\frac{d}{dt}\mathcal{L}(t) + \|U_2(t)\|_{L^2}^2 + \eta \|U(t)\|_{L^2}^2 \leq \eta \|U_2(t)\|_{L^2}^2.$$

For η small enough, we have

$$\mathcal{L}(t) \sim \|U(t)\|_{L^2}^2$$

and thus

$$\frac{d}{dt}\mathcal{L}(t) + \eta\mathcal{L}(t) \leq 0.$$

Morale: The conservative part A of the system helped to propagate/rotate the partial dissipation of B.

Partially dissipative hyperbolic systems

• In the hyperbolic setting, the idea is essentially the same.

Main difficulty: The operators $A\partial_x$ and B are of a different order.

ightarrow Need to find a way to make them communicate as in the ODE setting.

Partially dissipative hyperbolic systems

• In the hyperbolic setting, the idea is essentially the same.

Main difficulty: The operators $A\partial_x$ and B are of a different order.

ightarrow Need to find a way to make them communicate as in the ODE setting.

Two approaches:

Fourier-based approach. (Shizuta-Kawashima, Yong, Beauchard-Zuazua, CB-Danchin)

Roughly, one can proceed as in the ODE setting by adding frequency weights to the Lyapunov functional.

- Time-weighted Fourier-free approach. (CB-Shou-Zuazua)
- \rightarrow Not optimal results but a broader range of applications e.g. numerics, bounded domains, nonlinear dissipation.

Partially dissipative hyperbolic systems

• In the hyperbolic setting, we follow the same idea.

Main difficulty: The operator $A\partial_x$ and B are of a different order \to how to make them communicate as in the ODE setting.

Two approaches:

Fourier-based approach. (Shizuta-Kawashima, Yong, Beauchard-Zuazua, CB-Danchin)

Essentially, one can proceed as in the ODE setting by adding frequency-weights to the Lyapunov functional.

- Time-weighted Fourier-free approach. (CB-Shou-Zuazua)
- \rightarrow Not optimal results but a broader range of application (e.g. numerics, bounded domains, nonlinear dissipation)

Beauchard and Zuazua's Result

We have the following result for

$$\partial_t U + A \partial_x U + B U = 0. (6)$$

Lemma (Beauchard-Zuazua '11)

The following statements are equivalent.

• The pair (A, B) satisfies the Kalman rank condition:

$$rank(B, BA, BA^2, \dots, BA^{n-1}) = n \tag{K}$$

• The solution of (6) with the initial data $U_0 \in L^1 \cap L^2$ satisfies

$$||U(t)||_{L^2} \le Ce^{-\min(1,\xi^2)t}||U_0||_{L^2}$$

and, for $U^\ell=\widehat{U}(t,\xi)\mathbf{1}_{|\xi|\leq 1}$ and $U^h=\widehat{U}(t,\xi)\mathbf{1}_{|\xi|\geq 1}$,

$$||U^{\ell}(t)||_{L^{\infty}} \le Ct^{-1/2}||U_0||_{L^1},\tag{7}$$

$$||U^h(t)||_{L^2} \le Ce^{-\gamma_* t} ||U_0||_{L^2},$$
 (8)

In the multi-dimensional setting: The Kalman rank condition leads to similar decay estimates but is not necessary to justify the stability.

Let us look at the damped *p*-system:

$$\begin{cases} \partial_t \rho + \partial_x u = 0, \\ \partial_t u + \partial_x \rho + u = 0. \end{cases}$$

Standard H^1 estimates:

$$\frac{d}{dt}\|(\rho, u, \partial_{\mathsf{x}}\rho\partial_{\mathsf{x}}u)\|_{L^{2}}^{2} + \|(u, \partial_{\mathsf{x}}u)\|_{L^{2}}^{2} = 0$$

Cross estimates:

$$\frac{d}{dt} \int_{\mathbb{R}} u \partial_x \rho \ dx + \|\partial_x \rho\|_{L^2}^2 = \|\partial_x u\|_{L^2}^2 + \int_{\mathbb{R}} u \partial_x \rho.$$

Let us look at the damped *p*-system:

$$\begin{cases} \partial_t \rho + \partial_x u = 0, \\ \partial_t u + \partial_x \rho + u = 0. \end{cases}$$

Standard H^1 estimates:

$$\frac{d}{dt}\|(\rho,u,\partial_x\rho\partial_xu)\|_{L^2}^2+\|(u,\partial_xu)\|_{L^2}^2=0$$

Cross estimates:

$$\frac{d}{dt} \int_{\mathbb{R}} u \partial_x \rho \ dx + \|\partial_x \rho\|_{L^2}^2 = \|\partial_x u\|_{L^2}^2 + \int_{\mathbb{R}} u \partial_x \rho.$$

Using Young inequality and gathering the estimates, we get

$$\frac{d}{dt}\mathcal{L}_{1}(t) + \|(u, \partial_{x}u)(t)\|_{L^{2}}^{2} + \|\partial_{x}\rho(t)\|_{L^{2}}^{2} \leq 0,$$
(9)

where

$$\mathcal{L}_1(t) = \|(\rho, u, \partial_x \rho, \partial_x u)\|_{L^2}^2 + \frac{1}{2} \int_{\mathbb{R}} u \partial_x \rho \, dx \sim \|(\rho, u, \partial_x \rho, \partial_x u)\|_{L^2}^2$$

How to get decay estimates from here?

Fourier heuristics

We have

$$\frac{d}{dt}\mathcal{L}_1(t) + \|(u, \partial_x u)(t)\|_{L^2}^2 + \|\partial_x \rho(t)\|_{L^2}^2 \le 0.$$
 (10)

Heuristically, applying the Fourier transform, it reads

$$\frac{d}{dt}\mathcal{L}_1(t) + \|\min(1,\xi)(\widehat{u},\widehat{\rho})\|_{L^2}^2 \le 0. \tag{11}$$

From which it is easy to obtain

- A heat behavior for low frequencies,
- Exponential decay for high frequencies:

$$\|(\rho, u)^{\ell}(t)\|_{L^{\infty}} \le Ct^{-1/2} \|(\rho_0, u_0)\|_{L^1},$$
 (12)

$$\|(\rho, u)^{h}(t)\|_{L^{2}} \le Ce^{-\gamma_{*}t}\|(\rho_{0}, u_{0})\|_{L^{2}}.$$
(13)

How to obtain (11) rigorously?

First approach: Beauchard-Zuazua's method

Consider

$$\mathcal{L}_{\xi}(t) = \left| (\widehat{\rho}, \widehat{u})(\xi, t) \right|^{2} + \frac{1}{2} \min \left(\frac{1}{|\xi|}, |\xi| \right) < \widehat{u} \cdot \widehat{\rho} >_{\mathbb{C}^{n}}. \tag{14}$$

Second approach:

Homogeneous Littlewood-Paley decomposition

 \rightarrow Allows to obtain precise decay rates, critical GWP results and to justify the strong relaxation limit.

ullet We define $\dot{\Delta}_j$ as dyadic blocks such that $f\in \mathcal{S}_h'(\mathbb{R}^d)$

$$f = \sum_{j \in \mathbb{Z}} \dot{\Delta}_j f$$
 and $\operatorname{supp}(\widehat{\dot{\Delta}_j f}) \subset \{ \xi \in \mathbb{R}^d \ \operatorname{t.q.} \ \frac{3}{4} 2^j \leq |\xi| \leq \frac{8}{3} 2^j \}.$

ullet We define $\dot{\Delta}_j$ as dyadic blocks such that $f\in \mathcal{S}_h'(\mathbb{R}^d)$

$$f = \sum_{j \in \mathbb{Z}} \dot{\Delta}_j f \quad \text{and} \quad \operatorname{supp}(\widehat{\dot{\Delta}_j f}) \subset \{ \xi \in \mathbb{R}^d \text{ t.q. } \frac{3}{4} 2^j \leq |\xi| \leq \frac{8}{3} 2^j \}.$$

• The main motivation behind this decomposition is the following Bernstein inequality: $\forall k \in \mathbb{N}, \ p \in [1, \infty],$

$$c2^{jk}\|\dot{\Delta}_{j}f\|_{L^{p}}\leq\|D^{k}\dot{\Delta}_{j}f\|_{L^{p}}\leq C2^{jk}\|\dot{\Delta}_{j}f\|_{L^{p}}.$$

ullet We define $\dot{\Delta}_j$ as dyadic blocks such that $f\in \mathcal{S}_h'(\mathbb{R}^d)$

$$f = \sum_{j \in \mathbb{Z}} \dot{\Delta}_j f \quad \text{and} \quad \operatorname{supp}(\widehat{\dot{\Delta}_j f}) \subset \{ \xi \in \mathbb{R}^d \text{ t.q. } \frac{3}{4} 2^j \leq |\xi| \leq \frac{8}{3} 2^j \}.$$

• The main motivation behind this decomposition is the following Bernstein inequality: $\forall k \in \mathbb{N}, \ p \in [1, \infty],$

$$c2^{jk}\|\dot{\Delta}_{j}f\|_{L^{p}} \leq \|D^{k}\dot{\Delta}_{j}f\|_{L^{p}} \leq C2^{jk}\|\dot{\Delta}_{j}f\|_{L^{p}}.$$

The homogeneous Besov semi-norms are defined as follows:

$$||f||_{\dot{B}^s_{p,1}} \triangleq \sum_{j\in\mathbb{Z}} 2^{js} ||\dot{\Delta}_j f||_{L^p}.$$

 $\bullet \text{ We have } \dot{B}^0_{p,1} \hookrightarrow L^p, \ \ \dot{B}^1_{2,1} \hookrightarrow \dot{H}^1, \quad \dot{B}^{\frac{d}{2}}_{2,1} \hookrightarrow L^\infty \ \text{ and } \ \dot{B}^{\frac{d}{2}+1}_{2,1} \hookrightarrow \dot{W}^{1,\infty}$

ullet We define $\dot{\Delta}_j$ as dyadic blocks such that $f\in \mathcal{S}_h'(\mathbb{R}^d)$

$$f = \sum_{j \in \mathbb{Z}} \dot{\Delta}_j f \quad \text{and} \quad \operatorname{supp}(\widehat{\dot{\Delta}_j f}) \subset \{ \xi \in \mathbb{R}^d \text{ t.q. } \frac{3}{4} 2^j \leq |\xi| \leq \frac{8}{3} 2^j \}.$$

• The main motivation behind this decomposition is the following Bernstein inequality: $\forall k \in \mathbb{N}, \ p \in [1, \infty],$

$$c2^{jk}\|\dot{\Delta}_j f\|_{L^p} \leq \|D^k\dot{\Delta}_j f\|_{L^p} \leq C2^{jk}\|\dot{\Delta}_j f\|_{L^p}.$$

The homogeneous Besov semi-norms are defined as follows:

$$||f||_{\dot{B}^s_{p,1}} \triangleq \sum_{j\in\mathbb{Z}} 2^{js} ||\dot{\Delta}_j f||_{L^p}.$$

- $\bullet \text{ We have } \dot{B}^0_{p,1} \hookrightarrow L^p, \ \ \dot{B}^1_{2,1} \hookrightarrow \dot{H}^1, \quad \dot{B}^{\frac{d}{2}}_{2,1} \hookrightarrow L^\infty \ \text{ and } \ \dot{B}^{\frac{d}{2}+1}_{2,1} \hookrightarrow \dot{W}^{1,\infty}$
- For a threshold $J_0 \in \mathbb{Z}$ and $s, s' \in \mathbb{R}$, we define the high and low norms:

$$\|f\|_{\dot{B}^s_{2,1}}^h \triangleq \sum_{j \geq J_0} 2^{js} \|\dot{\Delta}_j f\|_{L^2} \quad \text{and} \quad \|f\|_{\dot{B}^{s'}_{p,1}}^\ell \triangleq \sum_{j \leq J_0} 2^{js'} \|\dot{\Delta}_j f\|_{L^p}.$$

Back to the damped *p*-system:

$$\begin{cases} \partial_t \rho + \partial_x u = 0, \\ \partial_t u + \partial_x \rho + u = 0.. \end{cases}$$
 (15)

Applying the localisation operator $\dot{\Delta}_j$ to (15) and denoting $\dot{\Delta}_j f = f_j$, we have

$$\begin{cases} \partial_t \rho_j + \partial_x u_j = 0, \\ \partial_t u_j + \partial_x \rho_j + u_j = 0. \end{cases}$$
 (16)

Back to the damped *p*-system:

$$\begin{cases} \partial_t \rho + \partial_x u = 0, \\ \partial_t u + \partial_x \rho + u = 0.. \end{cases}$$
 (15)

Applying the localisation operator $\dot{\Delta}_j$ to (15) and denoting $\dot{\Delta}_j f = f_j$, we have

$$\begin{cases} \partial_t \rho_j + \partial_x u_j = 0, \\ \partial_t u_j + \partial_x \rho_j + u_j = 0. \end{cases}$$
 (16)

Differentiating in time $\mathcal{L}_j(t) = \|(\rho_j, u_j, \partial_x \rho_j, \partial_x u_j)(t)\|_{L^2}^2 + \frac{1}{2} \int_{\mathbb{R}} u_j \partial_x \rho_j \, dx$, we get

$$\frac{d}{dt}\mathcal{L}_{j}(t) + \|(u_{j}, \partial_{x}u_{j})\|_{L^{2}}^{2} + \|\partial_{x}\rho_{j}\|_{L^{2}}^{2} \leq 0.$$
 (17)

Using Bernstein inequality, we have

$$\frac{d}{dt}\mathcal{L}_{j}(t) + \min(1, 2^{2j}) \|(u_{j}, \rho_{j})\|_{L^{2}}^{2} \leq 0,$$
(18)

where $2^{2j} \sim |\xi|^2$.

We are going to use the following lemma.

Lemma

Let $p \ge 1$ and $X: [0,T] \to \mathbb{R}^+$ be a continuous function such that X^p is a.e. differentiable. If

$$\frac{1}{p}\frac{d}{dt}X^p + bX^p \le AX^{p-1} \quad a.e. \ on \ [0,T].$$

Then, for all $t \in [0, T]$, we have

$$X(t)+b\int_0^t X \leq X_0+\int_0^t A.$$

Applying this lemma to

$$\frac{d}{dt}\mathcal{L}_{j}(t) + \min(1, 2^{2j}) \|(u_{j}, \rho_{j})\|_{L^{2}}^{2} \le 0,$$
(19)

since $\mathcal{L}_i \sim \|(u_i, \rho_i)\|_{L^2}^2$, we obtain

$$\sqrt{\mathcal{L}_{j}(t)} + \min(1, 2^{2j}) \int_{0}^{t} \|(u_{j}, \rho_{j})\|_{L^{2}} \leq 0.$$
 (20)

$$\|(u_j,\rho_j)(t)\|_{L^2} + \min(1,2^{2j}) \int_0^t \|(u_j,\rho_j)\|_{L^2} \le 0.$$
 (21)

$$\|(u_j,\rho_j)(t)\|_{L^2} + \min(1,2^{2j}) \int_0^t \|(u_j,\rho_j)\|_{L^2} \le 0.$$
 (21)

• For high frequencies: $j \ge 0 \implies \min(1, 2^{2j}) = 1$.

Multiplying (21) by 2^{js} for $s \in \mathbb{R}$ and summing on $j \geq 0$, we obtain

$$\|(u,\rho)(t)\|_{\dot{B}^{s}_{2,1}}^{h}+\|(u,\rho)\|_{L^{1}_{T}(\dot{B}^{s}_{2,1})}^{h}\leq 0.$$

$$\|(u_j,\rho_j)(t)\|_{L^2} + \min(1,2^{2j}) \int_0^t \|(u_j,\rho_j)\|_{L^2} \le 0.$$
 (21)

• For high frequencies: $j \ge 0 \implies \min(1, 2^{2j}) = 1$.

Multiplying (21) by 2^{js} for $s \in \mathbb{R}$ and summing on $j \geq 0$, we obtain

$$\|(u,\rho)(t)\|_{\dot{B}^{s}_{2,1}}^{h}+\|(u,\rho)\|_{L^{1}_{T}(\dot{B}^{s}_{2,1})}^{h}\leq 0.$$

• For low frequencies: $j \leq 0 \implies \min(1, 2^{2j}) = 2^{2j}$ which leads to

$$\|(u,\rho)(t)\|_{\dot{B}^{s}_{2,1}}^{\ell}+\|(u,\rho)\|_{L^{1}_{T}(\dot{B}^{s+2}_{2,1})}^{\ell}\leq 0.$$

$$\|(u_j,\rho_j)(t)\|_{L^2} + \min(1,2^{2j}) \int_0^t \|(u_j,\rho_j)\|_{L^2} \le 0.$$
 (21)

• For high frequencies: $j \ge 0 \implies \min(1, 2^{2j}) = 1$.

Multiplying (21) by 2^{js} for $s \in \mathbb{R}$ and summing on $j \geq 0$, we obtain

$$\|(u,\rho)(t)\|_{\dot{B}_{2,1}^{s}}^{h}+\|(u,\rho)\|_{L_{T}^{1}(\dot{B}_{2,1}^{s})}^{h}\leq 0.$$

• For low frequencies: $j \leq 0 \implies \min(1, 2^{2j}) = 2^{2j}$ which leads to

$$\|(u,\rho)(t)\|_{\dot{B}^{s}_{2,1}}^{\ell}+\|(u,\rho)\|_{L^{1}_{T}(\dot{B}^{s+2}_{2,1})}^{\ell}\leq 0.$$

- Heat effect in low frequencies and exponential decay in high frequencies.
- From here: optimal decay rates using time-weights and interpolations.
- ullet Notice the $L^1_T(B^{s+2}_{2,1})$ norm compared to the usual $L^2_T(H^{s+1})$ norm.

General hyperbolic hypocoercivity

Back to

$$\partial_t U + A \partial_x U + B U = 0.$$

Under the Kalman rank condition (or the Shizuta-Kawashima) condition for (A, B), differentiating in time the following functional

$$\mathcal{L}_j(t) = \|U_j(t)\|_{H^1}^2 + \eta \int_{\mathbb{R}} \left(\sum_{k=1}^{n-1} < BA^{k-1}U_j, BA^k\partial_x U_j > \right)$$

leads to

$$\frac{d}{dt}\mathcal{L}_j + \min(1, 2^{2j})\mathcal{L}_j \leq 0$$

and thus similar estimates.

 What we have just seen allows us to recover the classical existence results for nonlinear systems in a slightly better framework:

$$\dot{B}_{2,1}^{\frac{d}{2}} \cap \dot{B}_{2,1}^{\frac{d}{2}+1} \quad \text{vs} \quad H^s \quad \text{for } s > \frac{d}{2}+1.$$

Recalling that

$$H^s(s>rac{d}{2}+1)\hookrightarrow B_{2,1}^{rac{d}{2}+1}\hookrightarrow \dot{B}_{2,1}^{rac{d}{2}}\cap \dot{B}_{2,1}^{rac{d}{2}+1}\hookrightarrow \dot{B}_{p,2}^{rac{d}{p},rac{d}{2}+1}(p>2)\hookrightarrow \mathcal{C}_b^1.$$

 What we have just seen allows us to recover the classical existence results for nonlinear systems in a slightly better framework:

$$\dot{B}_{2,1}^{rac{d}{2}} \cap \dot{B}_{2,1}^{rac{d}{2}+1} \quad {
m vs} \quad {
m \it H}^{
m s} \quad {
m for} \, \, {
m \it s} > rac{d}{2}+1.$$

Recalling that

$$H^s(s>rac{d}{2}+1)\hookrightarrow B_{2,1}^{rac{d}{2}+1}\hookrightarrow \dot{B}_{2,1}^{rac{d}{2}}\cap \dot{B}_{2,1}^{rac{d}{2}+1}\hookrightarrow \dot{B}_{p,2}^{rac{d}{p},rac{d}{2}+1}(p>2)\hookrightarrow \mathcal{C}_b^1.$$

- However, that is not the full story for these systems. The low-frequency behaviour is more complex than what we just saw.
- A sharper understanding allow us to establish new results.

 What we have just seen allows us to recover the classical existence results for nonlinear systems in a slightly better framework:

$$\dot{B}_{2,1}^{rac{d}{2}} \cap \dot{B}_{2,1}^{rac{d}{2}+1} \quad {
m vs} \quad {
m \it H}^{
m s} \quad {
m for} \, \, {
m \it s} > rac{d}{2}+1.$$

Recalling that

$$H^s(s>rac{d}{2}+1)\hookrightarrow B_{2,1}^{rac{d}{2}+1}\hookrightarrow \dot{B}_{2,1}^{rac{d}{2}}\cap \dot{B}_{2,1}^{rac{d}{2}+1}\hookrightarrow \dot{B}_{p,2}^{rac{d}{p},rac{d}{2}+1}(p>2)\hookrightarrow \mathcal{C}_b^1.$$

- However, that is not the full story for these systems. The low-frequency behaviour is more complex than what we just saw.
- A sharper understanding allow us to establish new results.

Essentially:

- We have to go beyond "standard hypocoercivity" in the low frequencies.
- The eigenvalues in low-frequency are purely real → It is possible to decouple the system, up to linear high-order terms (good in LF).
- For that matter we introduce a purely damped mode, in contrast with the heat behavior, in the low-frequency regime,

Low-frequency analysis.

Back to the localized damped p-system:

$$\begin{cases} \partial_t u_j + \partial_x v_j = 0 \\ \partial_t v_j + \partial_x u_j + v_j = 0, \end{cases}$$

Back to the localized damped p-system:

$$\begin{cases} \partial_t u_j + \partial_x v_j = 0 \\ \partial_t v_j + \partial_x u_j + v_j = 0, \end{cases}$$

Defining the damped mode $w_j = v_j + \partial_x u_j$, the system can be rewritten

$$\begin{cases} \partial_t u_j - \partial_{xx}^2 u_j = -\partial_x w_j \\ \partial_t w_j + w_j = -\partial_{xx}^2 w_j - \partial_{xxx}^3 \rho_j. \end{cases}$$

Back to the localized damped p-system:

$$\begin{cases} \partial_t u_j + \partial_x v_j = 0 \\ \partial_t v_j + \partial_x u_j + v_j = 0, \end{cases}$$

Defining the damped mode $w_j = v_j + \partial_x u_j$, the system can be rewritten

$$\begin{cases} \partial_t u_j - \partial_{xx}^2 u_j = -\partial_x w_j \\ \partial_t w_j + w_j = -\partial_{xx}^2 w_j - \partial_{xxx}^3 \rho_j. \end{cases}$$

• This diagonalisation exhibits the low-frequency behaviour observed in the spectral analysis: $\lambda_1(\xi) = \xi^2$ and $\lambda_2(\xi) = 1$ for $\xi \ll 1$.

Back to the localized damped p-system:

$$\begin{cases} \partial_t u_j + \partial_x v_j = 0 \\ \partial_t v_j + \partial_x u_j + v_j = 0, \end{cases}$$

Defining the damped mode $w_i = v_i + \partial_x u_i$, the system can be rewritten

$$\begin{cases} \partial_t u_j - \partial_{xx}^2 u_j = -\partial_x w_j \\ \partial_t w_j + w_j = -\partial_{xx}^2 w_j - \partial_{xxx}^3 \rho_j. \end{cases}$$

- This diagonalisation exhibits the low-frequency behaviour observed in the spectral analysis: $\lambda_1(\xi) = \xi^2$ and $\lambda_2(\xi) = 1$ for $\xi \ll 1$.
- To deal with the linear source terms, we use the Bernstein inequality

$$\|\partial_x f\|_{\mathcal{B}^s_{\rho,1}}^\ell = \|f\|_{\mathcal{B}^{s+1}_{\rho,1}}^\ell = \sum_{j \leq J_0} 2^{j(s+1)} \|f_j\|_{L^p} \leq \sum_{j \leq J_0} 2^{js} 2^j \|f_j\|_{L^p} \leq J_0 \|f\|_{\mathcal{B}^s_{\rho,1}}^\ell.$$

where J_0 is the threshold between low and high frequencies that has to be chosen small enough.

Back to the localized damped p-system:

$$\begin{cases} \partial_t u_j + \partial_x v_j = 0 \\ \partial_t v_j + \partial_x u_j + v_j = 0, \end{cases}$$

Defining the damped mode $w_i = v_i + \partial_x u_i$, the system can be rewritten

$$\begin{cases} \partial_t u_j - \partial_{xx}^2 u_j = -\partial_x w_j \\ \partial_t w_j + w_j = -\partial_{xx}^2 w_j - \partial_{xxx}^3 \rho_j. \end{cases}$$

- This diagonalisation exhibits the low-frequency behaviour observed in the spectral analysis: $\lambda_1(\xi) = \xi^2$ and $\lambda_2(\xi) = 1$ for $\xi \ll 1$.
- To deal with the linear source terms, we use the Bernstein inequality

$$\|\partial_{x}f\|_{\mathcal{B}^{s}_{\rho,1}}^{\ell} = \|f\|_{\mathcal{B}^{s+1}_{\rho,1}}^{\ell} = \sum_{j \leq J_{0}} 2^{j(s+1)} \|f_{j}\|_{L^{p}} \leq \sum_{j \leq J_{0}} 2^{js} 2^{j} \|f_{j}\|_{L^{p}} \leq J_{0} \|f\|_{\mathcal{B}^{s}_{\rho,1}}^{\ell}.$$

where J_0 is the threshold between low and high frequencies that has to be chosen small enough.

• A priori estimates in a L^p framework for $2 \le p \le 4$ is available in the low-frequency regime. 4 D > 4 A D > 4 E > 4 B > 9 Q A

In the general case, the system can be rewritten as follows:

$$\begin{cases} \partial_t U_1 + A_{1,1} \partial_x U_1 + A_{1,2} \partial_x U_2 = 0, \\ \partial_t U_2 + A_{2,1} \partial_x U_1 + A_{2,2} \partial_x U_2 + DU_2 = 0. \end{cases}$$
 (22)

In the general case, the system can be rewritten as follows:

$$\begin{cases} \partial_t U_1 + A_{1,1} \partial_x U_1 + A_{1,2} \partial_x U_2 = 0, \\ \partial_t U_2 + A_{2,1} \partial_x U_1 + A_{2,2} \partial_x U_2 - DU_2 = 0. \end{cases}$$
 (23)

We define the damped mode

$$W \triangleq U_2 + D^{-1}A_{2,1}\partial_x U_1 + D^{-1}A_{2,2}\partial_x U_2 = D^{-1}\partial_t U_2.$$

In the general case, the system can be rewritten as follows:

$$\begin{cases}
\partial_t U_1 + A_{1,1} \partial_x U_1 + A_{1,2} \partial_x U_2 = 0, \\
\partial_t U_2 + A_{2,1} \partial_x U_1 + A_{2,2} \partial_x U_2 - DU_2 = 0.
\end{cases} (23)$$

We define the damped mode

$$W \triangleq U_2 + D^{-1}A_{2,1}\partial_x U_1 + D^{-1}A_{2,2}\partial_x U_2 = D^{-1}\partial_t U_2.$$

The system can be rewritten

$$\begin{cases}
\partial_t U_1 - A_{1,2} D^{-1} A_{2,1} \partial_x \partial_x U_1 = f \\
\partial_t W + DW = g
\end{cases}$$
(24)

where f and g are controllable in the low-frequency regime with Bernstein-type inequalities.

Question: What can we say about the second order operator $A_{1,2}D^{-1}A_{2,1}\partial_x\partial_x$ in the equation of U_1 ?

To study the equation of U_1 , we have the following property

Lemma

For D > 0, the following assertions are equivalent:

- (A,B) satisfy the Kalman rank condition,
- the operator $A := A_{1,2}D^{-1}A_{2,1}\partial_{xx}^2$ is strongly elliptic.
- \rightarrow We may study the equations of W and U_1 separately, the former as a damped equation and the latter as a heat equation.

• This approach can be applied to general systems of the form:

$$\begin{cases} \partial_t U + \sum_{j=1}^d A^j(U) \partial_{x_j} U + G(U) = 0, \\ U_0(x, t) = U_0(x), \end{cases}$$
 (25)

for solutions close to a constant equilibrium \bar{U} such that $G(\bar{U})=0$.

Important assumptions:

- $A_{1,1}(\bar{U})=0$ which means that $\bar{u}=0$ for fluid-type systems (Galilean transformation).
- ullet We need $ar{U}>$ 0, e.g. $ar{
 ho}>$ 0.

• This approach can be applied to general systems of the form:

$$\begin{cases} \partial_t U + \sum_{j=1}^d A^j(U) \partial_{x_j} U + G(U) = 0, \\ U_0(x, t) = U_0(x), \end{cases}$$
 (25)

for solutions close to a constant equilibrium \bar{U} such that $G(\bar{U})=0$.

Important assumptions:

- $A_{1,1}(\bar{U})=0$ which means that $\bar{u}=0$ for fluid-type systems (Galilean transformation).
- We need $\bar{U}>$ 0, e.g. $\bar{
 ho}>$ 0.

Tools to deal with the nonlinear terms:

• Embeddings for the type:

$$\dot{B}_{p,1}^{\frac{d}{p}} \hookrightarrow L^{\infty}, \quad \dot{B}_{p,1}^{\frac{d}{p}+1} \hookrightarrow \dot{W}^{1,\infty} \quad \text{and} \quad B_{2,1}^{s} \hookrightarrow B_{p,1}^{s}$$

• Advanced product laws, commutators estimate and composition estimates to deal with the $(L^2)^h\cap (L^p)^\ell$ setting:

$$\|ab\|_{\dot{B}^{s}_{2,1}}^{h} \lesssim \|a\|_{\dot{B}^{\frac{d}{p}}_{p,1}} \|b\|_{\dot{B}^{s}_{2,1}}^{h} + \|b\|_{\dot{B}^{\frac{d}{p}}_{p,1}} \|a\|_{\dot{B}^{s}_{2,1}}^{h} + \|a\|_{\dot{B}^{\frac{d}{p}-\frac{d}{p^{*}}}}^{\ell} \|b\|_{\dot{B}^{\sigma}_{p,1}}^{\ell} + \|b\|_{\dot{B}^{\sigma}_{p,1}}^{\ell} + \|b\|_{\dot{B}^{\sigma}_{p,1}}^{\ell}.$$

Well-posedness result for nonlinear systems.

We set $Z = U - \bar{U}$.

Theorem (Danchin, C-B '22 Math. Ann.)

Let $d \ge 1$, $p \in [2,4]$. There exists $c_0 = c_0(p) > 0$ and J_0 such that if

$$\|Z_0\|_{\dot{B}^{\frac{d}{p}}_{p,1}}^{\ell} + \|Z_0\|_{\dot{B}^{\frac{d}{2}+1}_{2,1}}^{h} \leq c_0,$$

then the system admits a unique solution Z satisfying

$$X_{p}(t) \lesssim \|Z_{0}\|_{\dot{B}^{rac{d}{p}}_{p,1}}^{\ell} + \|Z_{0}\|_{\dot{B}^{rac{d}{2}+1}_{2,1}}^{h} \quad ext{for all } t \geq 0,$$

where

$$\begin{split} X_{p}(t) &\triangleq \|Z\|_{L_{t}^{\infty}(\dot{\mathcal{B}}_{2,1}^{\frac{d}{2}+1})}^{h} + \|Z\|_{L_{t}^{1}(\dot{\mathcal{B}}_{2,1}^{\frac{d}{2}+1})}^{h} + \|Z_{2}\|_{L_{t}^{2}(\dot{\mathcal{B}}_{p,1}^{\frac{d}{p}})} \\ &+ \|Z\|_{L_{t}^{\infty}(\dot{\mathcal{B}}_{p,1}^{\frac{d}{p}})}^{\ell} + \|Z_{1}\|_{L_{t}^{1}(\dot{\mathcal{B}}_{p,1}^{\frac{d}{p}+2})}^{\ell} + \|Z_{2}\|_{L_{t}^{1}(\dot{\mathcal{B}}_{p,1}^{\frac{d}{p}+1})}^{\ell} + \|W\|_{L_{t}^{1}(\dot{\mathcal{B}}_{p,1}^{\frac{d}{p}})}^{\ell}. \end{split}$$

 $\underline{\mathsf{Proof:}}$ Previous linear analysis + Perturbation and Bootstrap arguments.

Extensions

 The hypocoercive-type analysis can be extended to general system of any order

$$\partial_t V + A(D)V + L(D)V = 0$$
, where

- A(D) is a skew-symmetric homogeneous Fourier multiplier of order α ,
- L(D) is a partially elliptic homogeneous Fourier multiplier of order β .
- What dictates the decay rates is difference of order between A and L.

Extensions

 The hypocoercive-type analysis can be extended to general system of any order

$$\partial_t V + A(D)V + L(D)V = 0$$
, where

- A(D) is a skew-symmetric homogeneous Fourier multiplier of order α ,
- L(D) is a partially elliptic homogeneous Fourier multiplier of order β .
- What dictates the decay rates is difference of order between A and L.
- Anisotropic case (cf. Bianchini-CB-Paicu) concerning stably stratified solutions of the 2D-Boussinesq system.
- Open question: What kind of nonlinearities can we include depending on the partial effect occuring? Relation between partial dissipation, hyperbolicity and anisotropy.

Extensions

 The hypocoercive-type analysis can be extended to general system of any order

$$\partial_t V + A(D)V + L(D)V = 0$$
, where

- A(D) is a skew-symmetric homogeneous Fourier multiplier of order α ,
- L(D) is a partially elliptic homogeneous Fourier multiplier of order β .
- What dictates the decay rates is difference of order between A and L.
- Anisotropic case (cf. Bianchini-CB-Paicu) concerning stably stratified solutions of the 2D-Boussinesq system.
- Open question: What kind of nonlinearities can we include depending on the partial effect occurring? Relation between partial dissipation, hyperbolicity and anisotropy.
- Another interesting case

$$\partial_t U + A \partial_x U + B U = 0$$

for A symmetric and B non-symmetric e.g. Euler-Maxwell system or Timoshenko system

• One must consider Kalman rank condition for (B^s, B^a) where B^s is the symmetric part of B and B^a the skew-symmetric part.

Second part: Relaxation procedure and hyperbolisation

Cattaneo approximation of the heat equation

Let us consider the heat equation on \mathbb{R}^d

$$\partial_t \rho - \Delta \rho = 0.$$

Its hyperbolic Cattaneo approximation reads

$$\begin{cases} \partial_t \rho_{\varepsilon} + \partial_x u_{\varepsilon} = 0, \\ \varepsilon^2 \partial_t u_{\varepsilon} + \partial_x \rho_{\varepsilon} + u_{\varepsilon} = 0. \end{cases}$$
 (26)

When $\varepsilon \to 0$, we recover a heat equation for ρ and a Darcy-type law $u = \partial_x \rho$.

Cattaneo approximation of the heat equation

Let us consider the heat equation on \mathbb{R}^d

$$\partial_t \rho - \Delta \rho = 0.$$

Its hyperbolic Cattaneo approximation reads

$$\begin{cases} \partial_t \rho_{\varepsilon} + \partial_x u_{\varepsilon} = 0, \\ \varepsilon^2 \partial_t u_{\varepsilon} + \partial_x \rho_{\varepsilon} + u_{\varepsilon} = 0. \end{cases}$$
 (26)

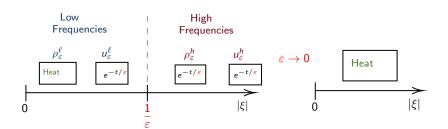

When $\varepsilon \to 0$, we recover a heat equation for ρ and a Darcy-type law $u = \partial_x \rho$.

- System (26) has a partially dissipative and hyperbolic structure.
- Dissipative hyperbolisation.
- How to justify the limit $\varepsilon \to 0$ rigorously?

Solution first! Spectral analysis

Cattaneo approximation:

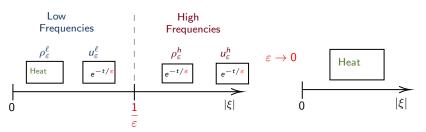

$$\begin{cases} \partial_t \rho_{\varepsilon} + \partial_x u_{\varepsilon} = 0 \\ \varepsilon^2 \partial_t u_{\varepsilon} + \partial_x \rho_{\varepsilon} + u_{\varepsilon} = 0 \end{cases} \xrightarrow{\epsilon \to 0} \partial_t \rho - \partial_{xx}^2 \rho = 0$$

Solution first! Spectral analysis

Cattaneo approximation:

$$\begin{cases} \partial_t \rho_{\varepsilon} + \partial_x u_{\varepsilon} = 0 \\ \varepsilon^2 \partial_t u_{\varepsilon} + \partial_x \rho_{\varepsilon} + u_{\varepsilon} = 0 \end{cases} \xrightarrow{\varepsilon \to 0} \partial_t \rho - \partial_{xx}^2 \rho = 0$$

- The Cattaneo approximation creates a high-frequency regime where the solution is exponentially damped.
- The high-frequency regime vanishes in the relaxation limit.
- **Goal:** Justify this process for nonlinear systems.

Spaces

• We work with the following hybrid homogeneous Besov norms:

$$\|f\|_{\dot{B}^s_{2,1}}^h \triangleq \sum_{j \geq \frac{\eta}{\varepsilon}} 2^{js} \|\dot{\Delta}_j f\|_{L^2} \quad \text{and} \quad \|f\|_{\dot{B}^{s'}_{p,1}}^\ell \triangleq \sum_{j \leq \frac{\eta}{\varepsilon}} 2^{js'} \|\dot{\Delta}_j f\|_{L^p}.$$

• We work with the following hybrid homogeneous Besov norms:

$$\|f\|_{\dot{B}^s_{2,1}}^h \triangleq \sum_{j \geq \frac{\eta}{\varepsilon}} 2^{js} \|\dot{\Delta}_j f\|_{L^2} \quad \text{and} \quad \|f\|_{\dot{B}^{s'}_{p,1}}^\ell \triangleq \sum_{j \leq \frac{\eta}{\varepsilon}} 2^{js'} \|\dot{\Delta}_j f\|_{L^p}.$$

 $\bullet \ \ \text{For low-frequencies:} \ j \leq \frac{\eta}{\varepsilon},$

$$\begin{cases} \partial_t \rho_j + \partial_x u_j = 0 \\ \varepsilon^2 \partial_t u_j + \partial_x \rho_j + u_j = 0, \end{cases}$$

defining the damped mode $w = v + \partial_x u$, the system can be rewritten as

$$\begin{cases} \partial_t \rho_j - \partial_{xx}^2 \rho_j = -\partial_x w, \\ \varepsilon \partial_t w_j + \frac{w_j}{\varepsilon} = -\varepsilon \partial_{xxx}^3 \rho_j - \varepsilon \partial_{xx}^2 w. \end{cases}$$

• We work with the following hybrid homogeneous Besov norms:

$$\|f\|_{\dot{B}^s_{2,1}}^h \triangleq \sum_{j \geq \frac{\eta}{\varepsilon}} 2^{js} \|\dot{\Delta}_j f\|_{L^2} \quad \text{and} \quad \|f\|_{\dot{B}^{s'}_{p,1}}^\ell \triangleq \sum_{j \leq \frac{\eta}{\varepsilon}} 2^{js'} \|\dot{\Delta}_j f\|_{L^p}.$$

 $\bullet \ \ \text{For low-frequencies:} \ j \leq \frac{\eta}{\varepsilon},$

$$\begin{cases} \partial_t \rho_j + \partial_x u_j = 0 \\ \varepsilon^2 \partial_t u_j + \partial_x \rho_j + u_j = 0, \end{cases}$$

defining the damped mode $w = v + \partial_x u$, the system can be rewritten as

$$\begin{cases} \partial_t \rho_j - \partial_{xx}^2 \rho_j = -\partial_x w, \\ \varepsilon \partial_t w_j + \frac{w_j}{\varepsilon} = -\varepsilon \partial_{xxx}^3 \rho_j - \varepsilon \partial_{xx}^2 w. \end{cases}$$

Due to the different threshold, the Bernstein inequality becomes:

$$\|\partial_x f\|_{B^s_{\rho,1}}^\ell \leq \frac{\eta}{\varepsilon} \|f\|_{B^s_{\rho,1}}^\ell.$$

For $s \in \mathbb{R}$, we have

$$\begin{split} \|(u,\varepsilon w)(t)\|_{B^{s}_{p,1}}^{\ell} + \|\rho\|_{L^{1}_{T}(B^{s+2}_{p,1})}^{\ell} + \frac{1}{\varepsilon}\|w\|_{L^{1}_{T}(B^{s}_{p,1})}^{\ell} \leq &\|(u_{0},w_{0})\|_{B^{s}_{p,1}}^{\ell} + \varepsilon\|w\|_{L^{1}_{T}(B^{s+2}_{p,1})}^{\ell} \\ &+ \varepsilon\|\rho\|_{L^{1}_{T}(B^{s+3}_{p,1})}^{\ell} \end{split}$$

For $s \in \mathbb{R}$, we have

$$\begin{split} \|(u,\varepsilon w)(t)\|_{B^{s}_{\rho,1}}^{\ell} + \|\rho\|_{L^{1}_{T}(B^{s+2}_{\rho,1})}^{\ell} + \frac{1}{\varepsilon}\|w\|_{L^{1}_{T}(B^{s}_{\rho,1})}^{\ell} \leq & \|(u_{0},w_{0})\|_{B^{s}_{\rho,1}}^{\ell} + \varepsilon\|w\|_{L^{1}_{T}(B^{s+2}_{\rho,1})}^{\ell} \\ & + \varepsilon\|\rho\|_{L^{1}_{T}(B^{s+3}_{\rho,1})}^{\ell} \end{split}$$

With the Berstein inequality, we have

$$\varepsilon \|\rho\|_{L^1_T(B^{s+3}_{p,1})}^\ell \leq \eta \|\rho\|_{L^1_T(B^{s+2}_{p,1})}^\ell \quad \text{and} \quad \varepsilon \|w\|_{L^1_T(B^{s+2}_{p,1})}^\ell \leq \frac{\eta^2}{\varepsilon} \|w\|_{L^1_T(B^s_{p,1})}^\ell.$$

Thus, choosing η small enough, these terms can be absorbed by the l.h.s.

For $s \in \mathbb{R}$, we have

$$\begin{split} \|(u,\varepsilon w)(t)\|_{B^{s}_{\rho,1}}^{\ell} + \|\rho\|_{L^{1}_{T}(B^{s+2}_{\rho,1})}^{\ell} + \frac{1}{\varepsilon}\|w\|_{L^{1}_{T}(B^{s}_{\rho,1})}^{\ell} \leq & \|(u_{0},w_{0})\|_{B^{s}_{\rho,1}}^{\ell} + \varepsilon\|w\|_{L^{1}_{T}(B^{s+2}_{\rho,1})}^{\ell} \\ & + \varepsilon\|\rho\|_{L^{1}_{T}(B^{s+3}_{\rho,1})}^{\ell} \end{split}$$

With the Berstein inequality, we have

$$\varepsilon \|\rho\|_{L^1_T(\mathcal{B}^{s+3}_{\rho,1})}^\ell \leq \eta \|\rho\|_{L^1_T(\mathcal{B}^{s+2}_{\rho,1})}^\ell \quad \text{and} \quad \varepsilon \|w\|_{L^1_T(\mathcal{B}^{s+2}_{\rho,1})}^\ell \leq \frac{\eta^2}{\varepsilon} \|w\|_{L^1_T(\mathcal{B}^{s}_{\rho,1})}^\ell.$$

Thus, choosing η small enough, these terms can be absorbed by the l.h.s.

• This estimate provides $\mathcal{O}(\varepsilon)$ bounds on $w=u+\partial_x\rho$ which is crucial to justify the relaxation.

For $s \in \mathbb{R}$, we have

$$\begin{split} \|(u,\varepsilon w)(t)\|_{B^{s}_{\rho,1}}^{\ell} + \|\rho\|_{L^{1}_{T}(B^{s+2}_{\rho,1})}^{\ell} + \frac{1}{\varepsilon}\|w\|_{L^{1}_{T}(B^{s}_{\rho,1})}^{\ell} \leq & \|(u_{0},w_{0})\|_{B^{s}_{\rho,1}}^{\ell} + \varepsilon\|w\|_{L^{1}_{T}(B^{s+2}_{\rho,1})}^{\ell} \\ & + \varepsilon\|\rho\|_{L^{1}_{T}(B^{s+3}_{\rho,1})}^{\ell} \end{split}$$

With the Berstein inequality, we have

$$\varepsilon \|\rho\|_{L^1_T(B^{s+3}_{p,1})}^\ell \leq \eta \|\rho\|_{L^1_T(B^{s+2}_{p,1})}^\ell \quad \text{and} \quad \varepsilon \|w\|_{L^1_T(B^{s+2}_{p,1})}^\ell \leq \frac{\eta^2}{\varepsilon} \|w\|_{L^1_T(B^s_{p,1})}^\ell.$$

Thus, choosing η small enough, these terms can be absorbed by the l.h.s.

- This estimate provides $\mathcal{O}(\varepsilon)$ bounds on $w=u+\partial_{\mathsf{x}}\rho$ which is crucial to justify the relaxation.
- High frequencies $j \geq \frac{\eta}{\varepsilon}$: Hypocoercivity-type approach but there is no damped mode!

High frequencies trick

To be able to recover $\mathcal{O}(\varepsilon)$ bounds on w in high frequencies, we use the Bernstein inequality

$$||f||_{B^s_{2,1}}^h \leq \frac{\varepsilon}{\eta} ||\partial_x f||_{B^s_{2,1}}^h.$$

High frequencies trick

To be able to recover $\mathcal{O}(\varepsilon)$ bounds on w in high frequencies, we use the Bernstein inequality

$$\|f\|_{B^s_{2,1}}^h \leq \frac{\varepsilon}{\eta} \|\partial_x f\|_{B^s_{2,1}}^h.$$

Say you want to obtain uniform bounds for w in $B_{2,1}^{\frac{d}{2}}$, then you should assume that the initial data are in $B_{2,1}^{\frac{d}{2}+1}$ and use that

$$\|w\|_{B_{2,1}^{\frac{d}{2}}}^{h} \leq \frac{\varepsilon}{\eta} \|w\|_{B_{2,1}^{\frac{d}{2}+1}}^{h}.$$

⇒ We must study the low and high frequencies are at different regularities.

Back to the compressible Euler equations

Back to the compressible Euler equations

The system reads:

$$\begin{cases} \partial_t \rho + \operatorname{div}(\rho u) = 0, \\ \varepsilon^2 (\partial_t u + u \cdot \nabla u) + \frac{\nabla P(\rho)}{\rho} + u = 0. \end{cases}$$
 (E)

The damped mode associated to the relaxation is $w = u + \frac{\nabla P(\rho)}{\rho}$.

Back to the compressible Euler equations

The system reads:

$$\begin{cases} \partial_t \rho + \operatorname{div}(\rho u) = 0, \\ \varepsilon^2 (\partial_t u + u \cdot \nabla u) + \frac{\nabla P(\rho)}{\rho} + u = 0. \end{cases}$$
 (E)

The damped mode associated to the relaxation is $w = u + \frac{\nabla P(\rho)}{\rho}$.

Inserting it in the above equation, we recover

$$\partial_t \rho - \Delta P(\rho) = \operatorname{div} w.$$

Back to the compressible Euler equations

The system reads:

$$\begin{cases} \partial_t \rho + \operatorname{div}(\rho u) = 0, \\ \varepsilon^2 (\partial_t u + u \cdot \nabla u) + \frac{\nabla P(\rho)}{\rho} + u = 0. \end{cases}$$
 (E)

The damped mode associated to the relaxation is $w=u+rac{
abla P(
ho)}{
ho}$.

Inserting it in the above equation, we recover

$$\partial_t \rho - \Delta P(\rho) = \operatorname{div} w.$$

ullet Let ${\mathcal N}$ be the solution of the porous media equation:

$$\partial_t \mathcal{N} - \Delta P(\mathcal{N}) = 0.$$

Then, using that $\|w\|_{L^1_T(B^s_{\rho,1})}=\mathcal{O}(\varepsilon)$, in the error estimates for $\widetilde{\rho}=\rho-\mathcal{N}$, we can justify that ρ converges strongly toward \mathcal{N} in $B^{s-1}_{\rho,1}$.

Relaxation result

Theorem (Danchin, C-B, Math. Ann. 2022)

Let $d \ge 1$, $p \in [2,4]$ and $\varepsilon > 0$.

- Let $\bar{\rho}$ be a strictly positive constant and $(\rho^{\varepsilon} \bar{\rho}, u^{\varepsilon})$ be the solution of the compressible Euler system with damping (constructed with the previous arguments)
- Let $\mathcal{N} \in \mathcal{C}_b(\mathbb{R}^+; \dot{B}^{\frac{d}{p}}_{p,1}) \cap L^1(\mathbb{R}^+; \dot{B}^{\frac{d}{p}+2}_{p,1})$ be the unique solution associated to the Cauchy problem:

$$\begin{cases} \partial_t \mathcal{N} - \Delta P(\mathcal{N}) = 0 \\ \mathcal{N}(0, x) = \mathcal{N}_0 \in \dot{B}_{p, 1}^{\frac{d}{p}} \end{cases}$$

If we assume that

$$\|\rho_0^{\varepsilon} - \mathcal{N}_0\|_{\mathcal{B}^{\frac{d}{p}-1}_{p_1}} \leq C\varepsilon,$$

then

$$\|\rho^{\varepsilon} - \mathcal{N}\|_{L^{\infty}(\mathbb{R}_{+}; \dot{B}^{\frac{d}{p}-1}_{\rho,1})} + \|\rho^{\varepsilon} - \mathcal{N}\|_{L^{1}(\mathbb{R}_{+}; \dot{B}^{\frac{d}{p}+1}_{\rho,1})} + \left\|\frac{\nabla P(\rho^{\varepsilon})}{\rho^{\varepsilon}} + u^{\varepsilon}\right\|_{L^{1}(\mathbb{R}^{+}; \dot{B}^{\frac{d}{p}}_{\rho,1})} \leq C\varepsilon.$$

Remarks

Remarks

- Performing a similar analysis with Sobolev spaces does not allow (to the best of my knowledge) to exhibit an explicit convergence rate.
- It only leads to $\|w\|_{L^2_{\tau}(H^s)} = \mathcal{O}(1)$ vs $\|w\|_{L^1_{\tau}(B^s_{2,1})} = \mathcal{O}(\varepsilon)$

Remarks

- Performing a similar analysis with Sobolev spaces does not allow (to the best of my knowledge) to exhibit an explicit convergence rate.
- It only leads to $\|w\|_{L^2_{\tau}(H^s)} = \mathcal{O}(1)$ vs $\|w\|_{L^1_{\tau}(B^s_{2,1})} = \mathcal{O}(\varepsilon)$
- First result to establish the strong relaxation limit in the multi-dimensional setting.
- It can be employed in many other contexts.

Application to a (partially) hyperbolic Navier-Stokes system

Hyperbolic Navier-Stokes equations

We have just seen that the equation

$$\partial_t u - \Delta u = 0$$

can be approximated, for a small arepsilon, by the following hyperbolic system

$$\begin{cases} \partial_t u + \operatorname{div} v = 0 \\ \varepsilon^2 \partial_t v + \nabla u + v = 0. \end{cases}$$

 Our aim is now to understand to what extent this approximation can be used to approximate systems modelling physical phenomena.

Hyperbolic Navier-Stokes equations

We have just seen that the equation

$$\partial_t u - \Delta u = 0$$

can be approximated, for a small ε , by the following hyperbolic system

$$\begin{cases} \partial_t u + \operatorname{div} v = 0 \\ \varepsilon^2 \partial_t v + \nabla u + v = 0. \end{cases}$$

 Our aim is now to understand to what extent this approximation can be used to approximate systems modelling physical phenomena.

Performing such approximation for the compressible Navier-Stokes system, one has

$$\begin{cases} \partial_{t}\rho + \operatorname{div}(\rho u) = 0, \\ \partial_{t}(\rho u) + \operatorname{div}(\rho u \otimes u) + \nabla p = \operatorname{div}\tau, \\ \partial_{t}(\rho T) + \operatorname{div}(\rho u T + up) + \operatorname{div}q - \operatorname{div}(\tau \cdot u) = 0, \\ \varepsilon^{2}\partial_{t}q + q + \kappa \nabla T = 0, \end{cases}$$
 (NSCC)

Let us now see how to justify that the solution of this system converge to the solution of the classical Navier-Stokes equations.

• For the limit system: Danchin showed the existence of solutions satisfying different properties for $|\xi| \leq K$ and $|\xi| \geq K$ where K is a large constant.

- For the limit system: Danchin showed the existence of solutions satisfying different properties for $|\xi| \leq K$ and $|\xi| \geq K$ where K is a large constant.
- \bullet The hyperbolic approximation suggests to cut at $\frac{1}{\varepsilon}.$

- For the limit system: Danchin showed the existence of solutions satisfying different properties for $|\xi| \leq K$ and $|\xi| \geq K$ where K is a large constant.
- \bullet The hyperbolic approximation suggests to cut at $\frac{1}{\varepsilon}.$

In order to obtain the complete picture, we divide the frequency space as:

- For the limit system: Danchin showed the existence of solutions satisfying different properties for $|\xi| \leq K$ and $|\xi| \geq K$ where K is a large constant.
- \bullet The hyperbolic approximation suggests to cut at $\frac{1}{\varepsilon}.$

In order to obtain the complete picture, we divide the frequency space as:

Formally, when $\varepsilon \to 0$, it means that:

- The low frequency regime is not modified.
- The mid-frequency regime becomes larger and larger and recovers the high-frequency regime.
- The high frequency regime disappears in we recover the limit system.

Tools

• We define homogeneous Besov spaces restricted in frequency as follows:

$$\begin{split} \|f\|_{\dot{B}^{s}_{p,1}}^{\ell} &:= \sum_{j \leq J_{0}} 2^{js} \|f_{j}\|_{L^{2}}, \qquad \|f\|_{\dot{B}^{s}_{p,1}}^{m,\varepsilon} := \sum_{J_{0} \leq j \leq J_{\varepsilon}} 2^{js} \|f_{j}\|_{L^{2}} \\ \text{and} \quad \|f\|_{\dot{B}^{s}_{p,1}}^{h,\varepsilon} &:= \sum_{j \geq J_{\varepsilon}-1} 2^{js} \|f_{j}\|_{L^{2}} \end{split}$$

where $J_0=K$, for K>0 a constant, and $J_{\varepsilon}=-\frac{1}{\varepsilon}$.

- In each regime, different methods have to be developed and patched together to derive a priori estimates.
- Hypocoercivity, efficient unknowns and limit system's analysis.
- Difficulty: handling the nonlinearities.

The Jin-Xin Approximation.

Jin-Xin Approximation

In collaboration with Ling-yun Shou (JDE), we justified the strong convergence of the diffusive Jin-Xin approximation

$$\begin{cases} \frac{\partial}{\partial t} u + \sum_{i=1}^{d} \frac{\partial}{\partial x_{i}} v_{i} = 0, \\ \varepsilon^{2} \frac{\partial}{\partial t} v_{i} + A_{i} \frac{\partial}{\partial x_{i}} u = -(v_{i} - f_{i}(u)), & i = 1, 2, ..., d, \end{cases}$$
(27)

toward viscous conservation laws:

$$\frac{\partial}{\partial t}u^* + \sum_{i=1}^d \frac{\partial}{\partial x_i} f_i(u^*) = \sum_{i=1}^d \frac{\partial}{\partial x_i} (A_i \frac{\partial}{\partial x_i} u^*), \tag{28}$$

Other applications:

- 2D-Boussinesq System (Bianchini-CB-Paicu) ARMA.
- Baer-Nunziato System (Burtea-CB-Tan), M3AS.
- Chemotaxis/Keller-Segel, (CB-He-Shou) SIAM.

Conclusion

- Hypocoercivity tells you that when the dissipation is not strong enough, its interactions with the hyperbolic part can make up for the lack of coercivity.
- When the skew-symmetric operator A and the dissipative B are of different order then the decay rates may not be exponential and the rates depend on the difference of their order.
- In the full space \mathbb{R}^d and the Torus \mathbb{T}^d , the classical hypocoercivity techniques need to be extended to treat the low frequencies.
- The hyperbolic relaxation creates a temporary exponentially stable high-frequency regime and the low frequencies correspond to the behavior of the limit system.

Thank you!

Formal link between (IPM) and (2D-B)

The 2-dimensional Boussinesq system read

$$\begin{cases} \partial_t \eta + \mathbf{u} \cdot \nabla \eta = 0, \\ \partial_t \mathbf{u} + \mathbf{u} \cdot \nabla \mathbf{u} + \nabla P = \eta \mathbf{g}, & \mathbf{g} = (0, -g), \\ \nabla \cdot \mathbf{u} = 0. \end{cases}$$
(E)

The linearized system around $\overline{\rho}_{eq}(y) = \rho_0 - y$, reads

$$\begin{cases} \partial_t b - \mathcal{R}_1 \Omega = 0, \\ \varepsilon^2 \partial_t \Omega - \mathcal{R}_1 b + \Omega = 0. \end{cases}$$
 (29)

where

$$\mathcal{R}_1 = rac{\partial_{\mathsf{x}}}{(-\Delta)^{-rac{1}{2}}}$$

Formally, as $\varepsilon \to 0$, the second equation gives the Darcy's law $\widetilde{\Omega}^\varepsilon = \mathcal{R}_1 \widetilde{b}^\varepsilon$ and inserting it in the first one gives the linear part of the incompressible porous media equation:

$$\partial_t \widetilde{b}^{\varepsilon} - \mathcal{R}_1^2 \widetilde{b}^{\varepsilon} = 0.$$

The HPC System

In joint work with Q. He and L-Y. Shou, we studied the following hyperbolic-parabolic system:

$$\begin{cases} \partial_t \rho + \operatorname{div}(\rho u) = 0, \\ \partial_t (\rho u) + \operatorname{div}(\rho u \otimes u) + \nabla P(\rho) + \frac{1}{\varepsilon} \rho u - \mu \rho \nabla \phi = 0, \\ \partial_t \phi - \Delta \phi - a\rho + b\phi = 0, & x \in \mathbb{R}^d, \quad t > 0, \end{cases}$$
(HPC)

In this case, when $\varepsilon \to 0$, we show that the diffusive-rescaled solution of (HPC) converges strongly to the solution of the Keller-Segel system:

$$\begin{cases} \partial_{t}\rho - \operatorname{div}(\nabla P(\rho) - \mu\rho\nabla\phi) = 0, \\ \rho u = -\nabla P(\rho) + \mu\rho\nabla\phi, \\ -\Delta\phi - a\rho + b\phi = 0, \end{cases}$$
 (KS)

Multifluid system

In a joint work with C. Burtea, J. Tan and L.-Y. Shou, we studied the following damped Baer-Nunziato system:

$$\begin{cases} \partial_{t}\alpha_{\pm} + u \cdot \nabla \alpha_{\pm} = \pm \frac{\alpha_{+}\alpha_{-}}{2\mu + \lambda} (P_{+}(\rho_{+}) - P_{-}(\rho_{-})), \\ \partial_{t}(\alpha_{\pm}\rho_{\pm}) + \operatorname{div}(\alpha_{\pm}\rho_{\pm}u) = 0, \\ \partial_{t}(\rho u) + \operatorname{div}(\rho u \otimes u) + \nabla P + \eta \rho u = 0, \\ \rho = \alpha_{+}\rho_{+} + \alpha_{-}\rho_{-}, \\ P = \alpha_{+}P_{+}(\rho_{+}) + \alpha_{-}P_{-}(\rho_{-}) \end{cases}$$
(BN)

Limit $\lambda, \mu, \nu \to 0$.

- Difficulties: the entropy that is naturally associated with this system is only positive semi-definite.
- The system (BN) is not a system of conservation laws
- We find an ad-hoc change of variables that enables us to symmetrize the system with a good structure to treat the nonlinear terms.

Overdamping

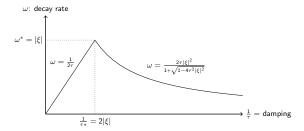

Figure: A graph of overdamping phenomenon for System (??).

Decay estimates

Theorem (Danchin, C-B '22)

Assuming additionally that $Z_0 \in \dot{B}_{2,\infty}^{-\sigma_1}$ for $\sigma_1 \in \left] - \frac{d}{2}, \frac{d}{2} \right]$ then there exists C > 0 such that

$$||Z(t)||_{\dot{B}_{2,\infty}^{-\sigma_1}} \leq C ||Z_0||_{\dot{B}_{2,\infty}^{-\sigma_1}}, \quad \forall t \geq 0.$$

Moreover, if $\sigma_1 > 1 - d/2$,

$$\langle t \rangle \triangleq \sqrt{1+t^2}, \quad \alpha_1 \triangleq \frac{\sigma_1 + \frac{d}{2} - 1}{2} \quad \text{and} \quad C_0 \triangleq \|Z_0\|_{\dot{B}^{-\sigma_1}_{2,\infty}}^{\ell} + \|Z_0\|_{\dot{B}^{\frac{d}{2}+1}_{\gamma_1}}^{h},$$

then Z satisfies the following decay estimates:

$$\begin{split} \sup_{t \geq 0} \left\| \langle t \rangle^{\frac{\sigma + \sigma_1}{2}} Z(t) \right\|_{\dot{B}^{\sigma}_{2,1}}^{\ell} &\leq \mathit{CC}_0 \ \ \mathit{if} \ \ -\sigma_1 < \sigma \leq \mathit{d}/2 - 1, \\ \sup_{t \geq 0} \left\| \langle t \rangle^{\frac{\sigma + \sigma_1}{2} + \frac{1}{2}} Z_2(t) \right\|_{\dot{B}^{\sigma}_{2,1}}^{\ell} &\leq \mathit{CC}_0 \ \ \mathit{if} \ \ -\sigma_1 < \sigma \leq \mathit{d}/2 - 2, \\ \mathit{and} \ \ \sup_{t \geq 0} \left\| \langle t \rangle^{2\alpha_1} Z(t) \right\|_{\dot{B}^{\frac{d}{2} + 1}_{2,1}}^{\ell} &\leq \mathit{CC}_0. \end{split}$$
